Slomiński, J. On the extending of models. III. Extensions in equationally definable classes of algebras. Fund. Math. 43 (1956), 69-76.

[For parts I-II see Łoś, Fund. Math. 42 (1955), 38-54; Łoś and Suszko, ibid. 42 (1955), 343-347; MR 17, 224, 815.] Pták [Českoslovack Mat. Z. 2(77) (1952), 247-271; MR 15, 598] gave an "algebraic" version of Malcev's characterization [Mat. Sb. N.S. 6(48) (1939), 331-336; 8(50) (1940), 251-264; MR 2, 7, 128], by means of universal sentences, of those semigroups which can be extended to a group. The author points out that Pták's argument applies to several equationally definable classes of algebras. But the only applications which he makes of this observation are the prehistoric theorems: each distributive structure can be extended to a Boolean algebra, and each semigroup can be extended to a ring.

Łoś, J.; Sasiada, E.; and Slomiński, Z. On abelian groups with hereditarily generating systems. Publ. Math. Debrecen 4 (1956), 351-356.

An abelian group is said to have a hereditarily generating system (h.g.s.) if it has an infinite system of generators such that every subsystem thereof which has the same power as a set is also a generating system for the group. A group with an h.g.s turns out to be countable. Any group of type  $p^\infty$  is an example. A torsion abelian group has an h.g.s. if and only if it is the direct sum of an infinite number of cyclic groups of prime power orders with no repetition of primes and of (possibly) a countable divisible group. An aperiodic abelian group with an h.g.s. is of finite rank, and, conversely, a divisible aperiodic group of finite rank has an h.g.s. The non-existence of non-cyclic homomorphic images suffices for the existence of an h.g.s. for a countable torsion group. It is an open question whether this same condition suffices in the case of torsionfree groups of finite rank.

SLOMINSKIY, G.L.

✓ 2090. On the present state of the theory of bond strength between the elements of multi-ply articles. G. L. SLOMINSKI. "Prochnost' Svyazi mezhdu Elementami Resino-Tkanevyykh Mnogosloinykh Izdelii . . ." 1964, p. 6-16. The stripping of multi-ply test pieces and other articles under repeated deformation is the result of fatigue of the boundary layer. The development of the process of fatigue is governed by the structure and composition of the fatigued material, and also by the pattern of the action. The difference between the fatigue of the boundary layer and that of homogeneous masses is governed by the variation in composition and structure, and also by the difference in the patterns of deformation of the boundary layer and of the homogeneous mass. The factors of mix formulation, technology and physico-mechanical factors, which affect each other, govern the structure and composition of the boundary layer. The pattern of the action of the mechanical forces at the boundary layer is determined by the external forces applied or by the deformations, by the construction of the multi-ply articles and the relation of the elastic properties of the materials (Young's modulus and Poisson's coefficient). One can construct the bases for this theory only by explaining the mechanism

1

1/2

*Sionimaki, G. L.*

of fatigue of the boundary layer. One must investigate the plastic and elastic properties of uncoupled mixes, the phenomena taking place at the surfaces of homogeneous raw mixes and composite raw mixes, and the process of vulcanization in the boundary layer. These questions must be investigated in their complex aspects, i.e., studying the interrelations of formulation, technology, and physico-chemical factors. In addition, it is necessary to analyze the influence of the structure and the elastic properties on the stresses set up in the zone of the joint. 3811.3

TITLE:

The Universal Diode-Functional Transformer

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy - Priborostroyeniye, 1958, Nr 5, pp 14-18 (USSR)

ABSTRACT:

Diode functional transformers are examined as regards their application. Such transformers with typical operational amplifiers are used normally with charges of a low ohmic resistance. Different operational amplifiers are described in detail. This subject has been treated already by G.I. Takhvanov, Candidate of Technical Sciences. The article then investigates ways to combine the block systems of the diode functional transformer, which are different in structure and composition, into one universal layout by using the operational amplifier with several inlets. The input voltage of the diode functional transformer changes as shown in formula 1. Figure 1 shows a block diagram of the operational amplifier. In his investigations the author found that the accuracy of per-
